

## Reverse Names

### Problem Description:

Write a program that will convert names in the LAST NAME, FIRST NAME MI format to FIRST NAME MI LAST NAME format. For example, given the name

Nixon, Richard M.

the program will convert it to:

Richard M. Nixon

You will read the names from a file and write the names to the console. The input file has one name per line and the last line in the file has a ".". The program should read the input filename from the user. The program should allow the user to repeat the operation as often as they wish.

### Example Output:

```
Enter the file you wish to process: names.txt
```

```
The reformatted names are:
```

```
John Q. Public
```

```
Madonna
```

```
Walter Savitch
```

```
Would you like to process another file? (Y or N): n
```

```
End program.
```

### Required Test Cases:

```
I:\gmayer\cis-121\names.txt
```
